

1 juries and the courts that have jurisdiction of those claims.

2 If you take what Grace is doing here at face value,
3 it never intended from the day it filed this case to use this
4 Chapter 11 proceeding for the normal purpose of restructuring
5 its business through arrangements with its creditors that the
6 Bankruptcy Code contemplates. In violation instead of the
7 spirit if not the letter of the Third Circuit's decision in the
8 SGL Carbon case, Grace is simply attempting to convert the
9 bankruptcy -- its bankruptcy case into a form of aggregate mass
10 tort litigation that it couldn't accomplish outside of
11 bankruptcy, and in the process it's basically trying to
12 convince this Court that the normal rules in claims allowance
13 that allow the claimant to -- you know, you've got to have an
14 objection to the claim.

15 I mean here under the bar date, Your Honor, Grace has
16 never objected to these claims. They're all deemed allowed
17 right now, because there's never been an objection filed. All
18 the claims were filed under POCs and the bar date. I mean,
19 obviously, they're not allowed, but I mean the whole notion of
20 a claim, an objection, a hearing, a right to defend yourself,
21 put your claim forward, a right to elect who your trial expert
22 is going to be as opposed to some guy who you might have gotten
23 some x-ray from while you were considering filing a lawsuit
24 against somebody, everything of that is just tossed out the
25 window, and it is simply not possible under the Bankruptcy

J&J COURT TRANSCRIBERS, INC.

1 Code. It's not a legitimate use of the Bankruptcy Code, and
2 I'm sure at the end of the day this Court will not countenance
3 it.

4 That said, I rather suspect that the Court is not
5 going to Daubertize any of the witnesses. We've been through a
6 process in some other cases before Your Honor, and so while I'm
7 going to turn the podium over now to others to address some of
8 that, particularly given the fact that Mr. Bernick didn't spend
9 a lot of time on most of the witnesses, hopefully, we will be
10 able to avoid having too much further discussion on that
11 subject. Thank you.

12 THE COURT: Mr. Finch.

13 MR. FINCH: Nathan Finch for the Asbestos Claimants
14 Committee. Don't show any graphics unless I tell you to.

15 The -- let's talk about what's not disputed here.
16 There is well-established epidemiology for the projected future
17 course of mesothelioma. Dr. Nicholson's projections, you heard
18 Mr. Bernick say that they were sound science.

19 Second, we know that 27 million Americans have been
20 occupationally exposed to asbestos.

21 Third, we know that Grace made asbestos-containing
22 products that were broadly used in a wide variety of places.
23 Their Monokote III, which is the asbestos spray on insulation
24 product, has been called one of the -- it become the dominant
25 fireproofing product in the country and was the focus of most

J&J COURT TRANSCRIBERS, INC.

1 of the litigation. They also made insulating cement and made
2 acoustical plaster, all of which had chrysotile asbestos that
3 was infected with Trimolite from the Canadian mines. They
4 have --

5 UNIDENTIFIED SPEAKER: Excuse me. If you could just
6 lean a -- I can hardly hear.

7 MR. FINCH: Sure. Excuse me, Your Honor. They have
8 admitted that -- testified -- their witnesses have testified
9 that Grace products have been identified by plaintiffs as being
10 on any kind of construction or industrial site. It runs the
11 whole gamut except for possibly shipyards. And, in fact, they
12 have actually lost some cases arising out of shipyards.

13 So you've got this huge toll of disease nationwide.
14 The United States government statistics show that the
15 mesothelioma incidence rate, what they actually count, is still
16 going up. I mean it's basically been flat for a long time, but
17 it's still going up. We've got, you know, 26/27 hundred
18 mesothelioma deaths in the United States now. The death rate
19 from asbestosis is going up, and the number of people who die
20 from asbestosis is only a very small fraction of the people
21 actually ultimately who have the disease.

22 And so the question is how do you estimate that
23 liability on Grace's part. And I'm going to first talk a
24 little bit about their methodology and explain why -- in
25 addition to the reasons Mr. Lockwood articulated, why it's just

J&J COURT TRANSCRIBERS, INC.

1 not reliable and doesn't fit the law. What Grace is ultimately
2 trying to do is take Daubert and turn it into a substantive
3 rule of decision under state law. Forty-six states have
4 Daubert or a version of Daubert. They call it Havner in Texas.
5 They call it High in Maryland. But the point is the scientific
6 basis for getting an expert's report or expert's opinion in
7 front of a jury, there's a mechanism to challenge that or has
8 been for many, many years after 1993 and in some states before
9 that.

10 So what they're trying to do is they're trying to say
11 only if you believe our experts, are -- would any case
12 conceivably get to a jury, and that's making a factual
13 determination that -- it's going to depend on the facts and
14 circumstances of each of the 100,000 individual cases. You
15 can't do it globally, and they're inconsistent with the law.
16 And a couple of the cases that we cited in our reply papers,
17 I'll just read you the quotes.

18 The first is the Rutherford case from California,
19 which the substantive rule in California says, "If plaintiff's
20 prove causation in asbestos-related cancer cases by
21 demonstrating that the plaintiff's exposure to the defendant's
22 asbestos-containing product in reasonable medical probability
23 was a substantial factor in contributing to the aggregate dose
24 of asbestos the plaintiff or decedent inhaled or ingested and,
25 hence, to the risk of developing asbestos-related cancer."

J&J COURT TRANSCRIBERS, INC.

1 There's no requirement that there's a doubling of the risk for
2 each exposure or each particular product.

3 The Berger vs. Amkin (phonetic) case, which is a case
4 in New York by the judge who has all of the asbestos cases in
5 New York, who listened to the testimony of Dr. Mogavkar, one of
6 Grace's experts here, and a lot of other experts trying to
7 Daubertize the -- or New York state law equivalent -- the
8 expert testimony from plaintiff experts in braverker cases,
9 which is a lower exposure and a different type of exposure than
10 the types of exposure we're talking about here. What the Court
11 wrote in that opinion, and this is at 818 New York South 2d
12 762, "Scientists and physicians use various means to establish
13 causation in particular situations, not the least of which are
14 toxicological and pathological studies and documented case
15 studies. While epidemiology may be the gold standard, it can't
16 be the only standard in an area where caution is both
17 particularistic and well established. Federal courts have also
18 held that epidemiological evidence is not necessary to
19 establish causation. It is not really important to have an
20 epidemiology study to determine whether the risk of cancer is
21 increased by asbestos exposure in every occupation."

22 That's what Grace is trying to do here. The ACC and
23 the FCR are going to call on medical experts, Dr. Laura Welch,
24 who is an industrial medicine doctor and an epidemiologist
25 who's run the largest screening epidemiological study of sheet

J&J COURT TRANSCRIBERS, INC.

1 metal workers, 17,000 workers over the past 20 years, Samuel
2 Hammar, a pathologist, a Dr. Rodwi (phonetic), another
3 pathologist, Arnold Brirody (phonetic), a cell biologist. All
4 of them basically take issue with Grace's threshold idea that
5 you need to have -- that only people who have personally mixed
6 or personally installed asbestos could be possibly be exposed
7 to enough Grace asbestos to cause their disease.

8 The fact is each case turns on its own individual
9 facts. The plaintiff in each of those cases would be able to
10 hire his or her own expert for the purposes of proving up a
11 case against Grace, and the medical literature -- there is
12 medical literature. Grace discounts the studies relied upon by
13 the doctors that the ACC and the FCR will put on, but the fact
14 is they do show an excess risk or a doubling or quadrupling of
15 the risk with fiber exposures down to well below one fiber a
16 year of exposure. And, you know, Grace can take issue with the
17 peer review medical literature, but that's a function of cross
18 examination that would come up in each individual case, and
19 Your Honor is not going to sit here and try 100,000 cases.

20 How much exposure and whether someone has an
21 asbestos-related disease turns on the facts and circumstances
22 of the case. And in a mesothelioma case -- and most of what
23 I'm talking about here is mesothelioma, and it's real --
24 there's not a dispute about the disease. It's just did the
25 defendant's asbestos contribute to the causation of the

J&J COURT TRANSCRIBERS, INC.

1 disease? And there's not -- it doesn't have to be that the
2 defendant's asbestos was the sole cause of the disease, or that
3 the defendant's asbestos doubled the risk, because it's
4 cumulative asbestos exposure which ultimately causes disease.
5 So that's their mix and install criteria for mesothelioma.

6 Another criteria they have is you have to have
7 radiologically diagnosable asbestosis in order to attribute
8 lung cancer to asbestos exposure. And the consensus medical
9 view by the Helsinki criteria, which is a group of experts with
10 over 1,000 years studying asbestos-related disease, have said
11 that you can have asbestos-related lung cancer if you have
12 sufficient exposure, but you don't need to have radiologically
13 diagnosable asbestosis. And, in fact, Grace's criteria don't
14 even permit someone to prove pathologically that they have
15 asbestosis, and I think Grace's experts would admit that if you
16 have asbestosis pathologically, it may not show up on an x-ray,
17 but you definitely have asbestosis.

18 And so even if you were to say that you need
19 underlying asbestos to attribute lung cancer to asbestos
20 exposure, which the medical literature says you don't need --
21 there's a lot of medical literature that says you don't need --
22 Grace's criteria rule out even the people who can prove it
23 pathologically.

24 The -- Mr. Bernick, quote, testified or talked about
25 various aspects of the tort system, and in the tort system --

J&J COURT TRANSCRIBERS, INC.

1 what people did and didn't do in the tort system. Whatever Mr.
2 Bernick says, whatever I say, whatever any of the lawyers say
3 up here is not evidence. We're going to -- you're going to
4 hear evidence from Steve Snyder, who's -- who has represented
5 companies in the tort system for over 20 years, from Dan Meyer,
6 who's a claims adjuster who's settled over -- he or his group
7 have settled over 200,000 asbestos claims, from Peter Krause
8 and John Cooney, who represent primarily mesothelioma victims,
9 about what the standards are in the tort system, what Grace
10 required in order to settle cases.

11 Mr. Bernick would have you believe that Grace settled
12 any case that came in the door without regard to whether it
13 posed a risk to it. In fact, for every case that Grace paid
14 money to -- and here I'd like to -- well, I'll pass on the
15 graphic. Grace required proof of exposure to a Grace product
16 sufficient to satisfy it and proof of disease to satisfy it,
17 and it paid the plaintiff the amount of money that was
18 something less than what he would recover at trial. Something
19 far less than what he would recover at trial, but both sides
20 are basically hedging their bets as to what might happen if
21 discover played out.

22 And the defense lawyers from Grace testified at
23 deposition, which is going to be their trial testimony -- since
24 they haven't been listed by witnesses, and we can't compel them
25 here by subpoena -- that the reason they chose to settle these

J&J COURT TRANSCRIBERS, INC.

1 cases and the standards they used to settle these cases was the
2 best way to minimize the liability.

3 MR. BERNICK: Yes, I'm reminded that the testimony
4 that Mr. Finch is reciting --

5 THE CLERK: I'm not picking you up, sir.

6 MR. BERNICK: I'm reminded that the testimony that
7 Mr. Finch is citing is testimony that was taken I believe
8 subject to a confidentiality order, because it relates to
9 settlement materials, and I believe that that was one of the
10 conditions pursuant to which we agreed to allow that discovery
11 to take place. So to the extent that Mr. Finch wants to get
12 into that, and I would I guess suggest that I believe that some
13 of this -- I'm not sure this is covered in the briefs, but to
14 the extent that Mr. Finch would want to get into it, I think
15 that we have an open court here, and I'm not sure that that
16 would be appropriate. I really don't want to spend a huge
17 amount of time on this, but I am compelled to point out that I
18 believe those are the terms of the order.

19 THE COURT: All right.

20 MR. FINCH: I'll pass that. That's the only
21 reference I'm going to have to this, Your Honor. I'm not going
22 to show any of the documents. Suffice it to say there's a lot
23 of them, and we'll put them into evidence at the appropriate
24 time.

25 We do have -- Grace did try some asbestos cases. It

J&J COURT TRANSCRIBERS, INC.

1 tried about 80 cases to judgment. It won about two thirds of
2 them, but the ones that lost, the judgments were catastrophic
3 compared to settlement averages.

4 Let's talk about the Peterson and Biggs estimation
5 methodology. The fact is that it is generally accepted in non
6 -- both in litigation and non-litigation settings. One of the
7 things we attached to our brief was an expert report from Tom
8 Florence in the Vellumoid case where he testified in the
9 Federal-Mogul cases this summer about Vellumoid's asbestos
10 liabilities, about the asbestos liabilities of Pneumo Abex,
11 about other asbestos liabilities, and in each and every one of
12 those reports he said, and I quote, that, "His estimates were
13 based on generally accepted forecasting methods and pre-
14 petition filing trends." And he goes on to describe, "The
15 forecasting processes incorporated the methods illustrated in
16 Nicholson and Perkel --" John, can we show this?

17 "The forecasting process incorporated the methods
18 illustrated in Nicholson, Perkel, and Selikoff, the courts have
19 accepted this or similar -- the same or similar methodologies
20 for forecasting future asbestos claims in numerous
21 proceedings."

22 And Dr. Peterson has studied asbestos litigation and
23 mast tort litigation for over 25 years. He's a Trustee of the
24 Manville Trust. He is a Trustee of the Fuller-Austin Trust.
25 He was a founding member of the Rand Institute for Civil

J&J COURT TRANSCRIBERS, INC.

1 Justice. He has been an expert for the courts in valuing
2 asbestos claims on four occasions. He has about as much
3 experience in studying the tort system as anyone out there.

4 Ms. Biggs has worked for insurance companies and
5 estimated liabilities using methodologies somewhat different,
6 but the basic -- fundamentally it's the same as Dr. Peterson.

7 Dr. Florence has that expertise, has the ability to
8 estimate liability of asbestos companies. In their briefs
9 Grace called Dr. Florence a statistician. I think he might be
10 somewhat offended by that. His -- he holds himself out and is
11 an expert in what's the liability of a company facing asbestos
12 claims.

13 And what Grace ignores in its Daubert challenges on
14 Dr. Peterson and Ms. Biggs is there are many types of science
15 and there are many types of specialized language, and the Rule
16 702 doesn't mean you have to be able to run a laboratory
17 experiment. You can have scientific, technical, or other
18 specialized knowledge to assist the trier of fact.

19 And, ultimately, the -- Daubert boils down to does
20 the expert employ in the courtroom the same level of
21 intellectual rigor that characterizes the practice of an expert
22 in a relevant field? And the answer to you, Your Honor, is
23 that is exactly what Dr. Peterson has done here, and that is
24 what Ms. Biggs has done here. They use the same methodologies
25 here they do in non-litigation settings outside of court.

J&J COURT TRANSCRIBERS, INC.

1 And why does the Nicholson methodology produce the
2 most reliable and the best estimates of a future liability of
3 an asbestos company? Three things that haven't changed for 25
4 years -- although Mr. Bernick talks about changes in the legal
5 system, what he's -- what Dr. Peterson's testimony was is you
6 can't predict today what the law is going to be in a particular
7 jurisdiction tomorrow, whether the federal government is going
8 to pass the fair act tomorrow. What we do know that over the
9 past -- ever since Borrell (phonetic) in 1973 that the law has
10 compensated mesothelioma claims and asbestos claims. We do
11 know the asbestos-related epidemiology. We know the future
12 time course of the asbestos-related cancers. And, finally, we
13 know that the best evidence of what a company's likely to pay
14 to reduce the judgment and settle cases tomorrow is what it's
15 paying today, taking into account the most recent trends. So
16 we have the disease curve. Now --

17 THE COURT: Would you say that last sentence for me
18 again? I'm sorry.

19 MR. FINCH: The best evidence of what a company is
20 going to pay to deal with asbestos liabilities tomorrow just is
21 what it is paying today taking into account the trends that
22 line up to where it is. Just like the best estimate of what
23 you're going to have to spend on gasoline next week is what
24 you're paying this week not what you're paying ten years ago.
25 The best evidence going forward is you take the most recent

J&J COURT TRANSCRIBERS, INC.

1 time and you project it forward based on what you know today
2 about the trends and what has happened since.

3 So what do we know about Dr. Peterson's methodology
4 and those trends? Could I have Dr. Peterson's report, the page
5 showing the claiming history?

6 THE COURT: Just a second, Mr. Finch. They have this
7 on a screen that's not facing me, and I can't see it. So hold
8 on one second, please.

9 (Pause)

10 THE COURT: Okay. Thank you.

11 MR. FINCH: I'll focus on the mesothelioma. That's
12 Grace's history of how many mesothelioma claims it got. Nobody
13 really disputes that. It's a continuing upward trend. Whether
14 you want to go back to 1980 or 1990 or 1995, it's a continuing
15 upward trend. Mr. Bernick makes a big deal out of the
16 2000/2001 period, but, in fact, the trend was apparent long
17 before that, and it's continued to go up.

18 Well, we have also Dr. Peterson and Ms. Bigg's
19 knowledge about the litigation environment. We have the Rand
20 report on asbestos litigation which has the total numbers of
21 claimants, various broken down by disease, and this -- you
22 know, Mr. Bernick said, oh, there aren't new claimants coming
23 in the system. Well, he's just wrong about that. You can see
24 from the 1990 all the way up through 2002 there's more
25 claimants coming into the system for mesothelioma. So that's

J&J COURT TRANSCRIBERS, INC.

1 the pattern for the data that we have. And so Dr. Peterson and
2 Ms. Biggs, to a greater or lesser extent, say, okay, we don't
3 have data for Grace after 2001, but we know the trends are up.
4 We know there's an upper limit, which is in the Nicholson
5 disease curve, whatever percentage of that. So there's nothing
6 that says that there's going to be a reversal of the trend in
7 Grace.

8 We do have data about the market generally, and the
9 reason people focus on the Manville Trust is, because
10 ultimately the Manville Trust gets 90 or 100 percent of the
11 asbestos claims. And the Manville Trust data shows that even
12 if you leave out 2003 for the U.S. exposures for mesothelioma,
13 the numbers and claims the Manville Trust were getting between
14 2004 and 2006 are about 20 percent higher than the last three
15 years to which we would have Grace data, which is 1998 to 2000.
16 And so people use the Manville Trust as a benchmark in non-
17 litigation settings as well as litigation settings.

18 I mean Dr. Dunbar, in a presentation he made to a
19 bunch of financial analysts, looked at the Manville Trust as
20 sort of a proxy for the market. Just like when you're valuing
21 a company, you look at the S&P 500 or the Dow Jones Industrial
22 Average as a proxy for the market. Well, you look to the
23 Manville experience here.

24 And so Dr. Peterson, using his expertise and his
25 knowledge and the knowledge of the trends, takes that and

J&J COURT TRANSCRIBERS, INC.

1 projects the future liability using Grace's historical values
2 taking into account the fact that just like its claim numbers
3 were going up the values were going up not just for Grace but
4 for many asbestos defendants. And the -- you know, they say
5 they have confidential data that shows that claim values have
6 declined somewhat.

7 One thing I would caution Your Honor is that in
8 viewing the evidence and listening to the testimony, they tend
9 to mix apples and oranges. So they go back and forth from
10 mesothelioma only to all types of claims and all values. It's
11 certainly the case that non-malignant claims have declined
12 substantially over the past three years, but the mesothelioma
13 values, there's no real evidence from any kind of publicly
14 available public source. Companies don't break out their
15 mesothelioma settlements in their financial statements.

16 The one thing we do know, if you turn to Page 29 of
17 Dr. Peterson's report, this shows Grace's history at the top.
18 Keep the whole page, John, the whole thing. Grace's history at
19 the top, which shows increasing mesothelioma values, increasing
20 lung cancer values, and what Dr. Peterson regards as comparable
21 companies. These are companies that were in the construction
22 industry that made construction-type products, USG, Turner, and
23 Newell.

24 And if you look at the bottom, there's a company
25 called Union Carbide, which has become one of the dominant

J&J COURT TRANSCRIBERS, INC.

1 asbestos defendants today. And if you look at the dollars out
2 the door -- this is from Union Carbide's financial statements.
3 It's publicly available. Dollars out the door, which is really
4 what we're trying to figure out here. Look at the dollars out
5 the door Union Carbide was paying in 2001, which is \$39
6 million, compared to the dollars out the door it's paying now,
7 which is about \$120 million. It's tripled, and there were some
8 years it was paying two or three hundred million dollars a
9 year.

10 So the idea that in the tort system companies are in
11 some kind of much better world I think is refuted by the
12 evidence and refuted by the testimony of the knowledgeable
13 witnesses, and I would urge Your Honor to listen to Dr.
14 Peterson's testimony, listen to Ms. Biggs' testimony, and focus
15 on the point that even under Grace's methodology they're
16 predicting what's going to happen over the next 40 or 50 years.
17 Sure, nobody can predict what the stock market's going to do
18 next week or next month or next year, but over the past 100
19 years the S&P 500 has gone up an average of 8 or 9 percent a
20 year. If you're trying to do a forecast of the next 30 or 40
21 years, you look at the long-term trends, and it would be a
22 pretty good estimate to say I believe, all things being equal,
23 20 years from now that the whole market is going to be 20
24 percent higher -- I mean ten -- eight percent higher per year
25 going over 20 years than what it was today. And so you start

J&J COURT TRANSCRIBERS, INC.

1 with the most recent period, and you project forward.

2 And, finally, Your Honor, I'll wrap up my time, so
3 that Mr. Mullady can focus on some specific points relating to
4 Ms. Biggs. Grace used the methodology to estimate asbestos
5 liabilities taking its past history in non-bankruptcy settings.

6 If you could put up the -- Tom Florence's -- excuse
7 me. If you could -- could I have, John, please ACC-89?

8 This is the estimate that Dr. Florence did for 1997
9 for business planning purposes at the time of the Sealed Air
10 decision. This will be an exhibit in the case. If you back up
11 one page -- back up to the other one. This is -- if you look
12 at the estimate of the indemnity arising from VI claims as
13 obtained I, that is the exact type of methodology. You know,
14 leaving aside some individual tweaks that Dr. Peterson and Ms.
15 Biggs use and what Dr. Peterson -- what Dr. Florence himself
16 does and contacts other than this case where he's being asked
17 just to count up the numbers.

18 When Grace -- the management wanted to estimate the
19 liability for pending claims at the same time, which is BD-605,
20 same document, they had 104,000 pending claims. This has been
21 shown in open court before, Ms. Baer.

22 MS. BAER: There was one that flashed by that wasn't.

23 MR. FINCH: Okay. This chart was shown in open
24 court, Your Honor. This chart was produced to the United
25 States government pursuant to a subpoena. I don't think

J&J COURT TRANSCRIBERS, INC.

1 there's any confidentiality left to that.

2 Grace had 100,000 cases pending in 1997. At the
3 time, as you'll see from Dr. Peterson's estimates, Grace was
4 paying about a third as much in meso cases and half as much as
5 lung cancer cases, and yet they still estimated the liability
6 for pending cases at \$325 million, which is almost as much as
7 what they're estimating for all their liability here under
8 their methodology.

9 And, finally, I will close, Your Honor, with two
10 thoughts. Number one, if Grace believed that this methodology
11 is so unreliable. Why does it -- and we -- in our briefs we
12 pointed this out to Your Honor. As late as December, 2006 it
13 was inviting one of its insurance companies to go look at Dr.
14 Peterson's estimate of liability in order to get money from an
15 insurance company. They said you can go get it. We can copy
16 Dr. Peterson's report from Sealed Air, which estimated
17 liability north of \$3 billion as of 1998. We can copy the
18 report, or you can get it from the bankruptcy docket. If Grace
19 thought -- this is Grace's in-house head of insurance. If
20 Grace thought that its -- the Peterson methodology was so
21 unreliable, why does it use it to get insurance coverage, to
22 get money for its -- from its insurers?

23 The final thought, Your Honor, that I'll leave you
24 with is Dr. Florence's methodology that he uses here and
25 Grace's whole methodology basically identifies the cases where

J&J COURT TRANSCRIBERS, INC.

1 Grace's experts can see that the plaintiff has a disease that
2 could be caused solely by exposure to Grace asbestos. When a
3 claim is found to be valid under tort law in our system of
4 justice, how much does a defendant pay? The defendant doesn't
5 pay a settlement value. The defendant pays what a jury
6 determines are the damages in the case. And we have evidence
7 of what juries have determined are the damages in cases
8 involving Grace where there is liability.

9 And I -- we have demonstrated to you and we will
10 demonstrate to you that if you buy into everything else about
11 Grace's methodology, which we disagree with and think is wrong,
12 and contrary to the Bankruptcy Code, if you value what's left
13 by reference of the judgments, which is the only methodology
14 which is consistent with a merits-based estimation, the
15 liability is at least \$12 billion. And with that I will turn
16 the lectern over to Mr. Mullady and sit down.

17 THE COURT: Why don't we take a ten-minute recess,
18 and then we'll start again, Mr. Mullady?

19 MR. MULLADY: Good suggestion, Your Honor. Thank
20 you.

21 THE COURT: Okay.

22 MR. BERNICK: Your Honor, for planning purposes,
23 about what do you have left on the clock (indiscernible).

24 UNIDENTIFIED SPEAKER: We --

25 MR. BERNICK: I think you started about --

J&J COURT TRANSCRIBERS, INC.

1 (Recess)

2 THE CLERK: Please be seated. Will the Court come to
3 order?

4 THE COURT: Mr. Mullady.

5 MR. MULLADY: Thank you, Your Honor. Good afternoon.
6 If it please the Court, Ray Mullady for the Future Claimants
7 Representative.

8 THE COURT: Just a minute, Mr. Mullday. Moana, do
9 you know how to turn that off? Do you -- the fan off --

10 THE CLERK: Just turn the --

11 THE COURT: -- that button off? I'm going to turn it
12 off, so we can hear you, Mr. Mullady, other -- and I apologize,
13 folks. It'll probably get hot. If some -- if you really start
14 to die, let me know, and I'll turn it back on, and we'll not
15 hear Mr. Mullady too well, but, hopefully, that won't change.
16 That should shut down in a few minutes. Go ahead, Mr. Mullady.

17 MR. MULLADY: Thank you, Your Honor. Good afternoon.
18 Once again, Ray Mullady for the Future Claimants
19 Representative, who is Mr. David Austern, who is in the
20 courtroom today seated back there next to Mr. Frankel. He may
21 have to get up and leave during my presentation. It's not out
22 of disinterest, but not coincidentally in connection with his
23 duties as claims administrator for the Dow Corning Trust, he
24 has an obligation to attend to later.

25 MR. BERNICK: Which that client is very grateful.

J&J COURT TRANSCRIBERS, INC.

1 MR. MULLADY: I'd like to begin, Your Honor, by
2 reminding the Court of the magnitude of Grace's liability to
3 future asbestos personal injury claimants. By the consensus of
4 all of the individuals who have estimated Grace's liability in
5 this case, the future claims liability is over 80 percent of
6 the total liability. Ms. Biggs has it at 90 percent. Mr.
7 Peterson has it at 89 percent. Even Dr. Florence, whose
8 estimate obviously is much lower, has it at 82 percent. And
9 Grace in its SEC filings most recently, it's 10k for the period
10 ending 12/31, 2000, projected that 84 percent of the liability
11 would fall in the future years.

12 Thus, Your Honor, if Grace's liability for asbestos
13 personal injury claims is channeled to a Section 524(g) trust,
14 by everyone's consensus over 80 percent of the assets in the
15 trust will be used to pay future claimants. For this reason,
16 the due process rights of future claimants who are absent
17 parties here are paramount. The U.S. Supreme Court has long
18 recognized that constitutional due process limits a court's
19 ability to rule on the merits of the claims of absent parties.
20 And that case is -- the case cite is Hansbury vs. Lee at 311 US
21 32, a 1940 case.

22 Thus, Your Honor, the due process rights of future
23 claimants limits this Court's ability to estimate Grace's
24 liability in a way that would involve ruling on the merits of
25 future claims. That's very important, yet this is what Grace's

J&J COURT TRANSCRIBERS, INC.

1 estimation methodology contemplates. The Bankruptcy Code also
2 insures that the rights of future claimants are protected in
3 cases involving a 524(g) trust, as the Court knows. That
4 section provides that the trust, "will value and be in a
5 position to pay," present and future claims, "in substantially
6 the same manner."

7 So we've heard a lot about merits-based estimation,
8 but make no mistake Grace's estimation methodology does not
9 assess the actual merits of future claims. Instead it
10 arbitrarily eliminates thousands of future claims and in the
11 process tramples the due process rights of claimants that we
12 just talked about. Can we have Exhibit 4, Tom?

13 This is a chart from Grace's Daubert opposition brief
14 at Page 32. The sliver of pending claims after Grace's
15 winnowing process is shown right down here. They start with
16 pending claims here. They eliminate those without a proof of
17 claim. They further eliminate claims that do not meet their
18 exposure criteria, and this last one here, no asbestos-related
19 disease. So what starts as a pending group here of claims,
20 becomes this tiny sliver here. Exhibit 5, Tom, please.

21 After this winnowing process is completed, we have
22 the future estimate down here. The Nicholson disease inputs
23 curve is up here. The only way this delta gets as wide as it
24 is in the Grace estimation is if history is completely
25 disregarded and new criteria are imposed to screen out claims

J&J COURT TRANSCRIBERS, INC.

1 that Grace traditionally paid pre-petition. And that is the
2 vagary of the process that they are using here with respect to
3 future claimants. So as to future claimants, the screening
4 process begins with the Grace PIQs, which were not completed by
5 future claimants, so the Court has no data on individual future
6 claims, only assumptions by Grace and their experts as to the
7 number of claims that will be filed, and a second assumption,
8 an unscientific prediction, about how many future claims will
9 be meritorious.

10 Now, we know that Dr. Florence allocates zero value
11 to thousands of future claims. This is undisputed. He does
12 this by failing to include large numbers of claimants in the
13 claim base that he uses for his future projections. But, as we
14 will see, his exclusions are unfair and deny claimants --
15 excuse me -- future claimants their due process rights.
16 Exhibit 6, please.

17 Now, Your Honor, this is a demonstrative. It's a
18 little bit playful. I hope Your Honor will give me a little
19 creative license here. But the concept is very, very serious,
20 and this is the best way I thought we could depict this. What
21 we show here in this first cut is a hypothetical game board.
22 The players are current asbestos personal injury claimants.
23 The object of the game is to reach the 524(g) trust here and be
24 eligible for compensation. Hypothetical future claimants are
25 shown here awaiting the outcome of the game, because under

J&J COURT TRANSCRIBERS, INC.

1 Grace's estimation methodology their fate is dictated by the
2 ability of future claimants -- excuse me -- current claimants
3 to reach the finish line here.

4 So the first player begins and gets to the first
5 question did I file a POC, a proof of claim. He did not, and
6 his claim is not paid. The future claimants are affected by
7 this denial, because the exclusion of this player and many
8 other players who did not file a proof of claim or the many who
9 did file proofs of claim that Dr. Florence could simply not
10 match to the CMS database, they're all used to under estimate
11 the number of future claims. This in turn results in fewer
12 assets being allocated to the 524(g) trust under Grace's
13 estimation, and note that the money bag has shrunk somewhat.

14 Our next player proceeds through the claim filter but
15 is asked whether he entered his claim in CMS before the
16 petition date. He answers no, and he's denied payment. The
17 524(g) trust shrinks even more. Future claimants ask
18 themselves why the value of their claims suffers as a result.
19 They didn't have pre-petition claims. They were not
20 responsible for Grace not timely entering claims into CMS.

21 The next player, he's asked whether his PIQ said that
22 he personally mixed or personally installed a Grace asbestos
23 product. He answers no. His claim is denied, and future
24 claimants ask the question why should we be affected. We
25 didn't file a PIQ. His PIQ said he didn't personally mix or

J&J COURT TRANSCRIBERS, INC.

1 install. We weren't sent PIQs. We aren't bound by Grace's
2 exposure criteria by any court. Even if in the future a 524(g)
3 trust is established, what are the odds that Grace's exposure
4 criteria will be used? They're not the law that they state,
5 and the trust criteria will have to be negotiated between the
6 debtor and the personal injury claimants and the futures rep.
7 Next, please.

8 The next player gives the wrong answer to the
9 question whether he identified a Grace product in his PIQ
10 response. He's sent to the do not pay category. The trust
11 shrinks further. Future claimants wonder why they are being
12 affected by the response of a claimant to a PIQ where the
13 claimant's case had not been fully developed at the time of the
14 Grace bankruptcy petition and where the automatic stay
15 prevented that claimant from taking any discovery against
16 Grace.

17 The next player is a pending claimant who did not
18 comply with Your Honor's x-ray order. My goodness, we heard
19 enough about that order over the last two or three years. His
20 claim is denied. The trust shrinks further. The future
21 claimants ask themselves why their recovery's been diluted.
22 They weren't subject to the Court's x-ray order.

23 When all is said and done, Your Honor, and, of
24 course, many claimants can pass through the various Grace
25 liability filters and make it to a position where they're

J&J COURT TRANSCRIBERS, INC.

1 eligible for payment under the trust, but for every claimant
2 that doesn't make it, numbers of future claimants by
3 extrapolation for the Dr. Florence methodology will not receive
4 full compensation for their claims. And at the end of the day
5 the money that is not paid to the future claimants is returned
6 Grace shareholders. It moves over there. And what was once
7 the province of future claimants becomes the province of Grace
8 shareholders. This is the game that Grace is playing here, and
9 this is why we thought this demonstrative was a good way to
10 depict it.

11 The future claimants, Your Honor, will submit their
12 claims against the trust over the next 50 years. This Court is
13 bound to estimate Grace's liability by taking into account the
14 future and as yet unasserted claims against Grace, and those
15 claims must be treated fairly and equitably. As we just saw,
16 Dr. Florence's methodology does just the opposite.

17 Now, of course, Dr. Florence disclaims all
18 responsibility for the assumptions that underlie his
19 calculation of the number of pending and future claims. He
20 instead follows the lead of Dr. Elizabeth Anderson, who opines
21 that certain categories of claims, as we've heard, have
22 insufficient exposure to Grace products to have a plausible
23 claim against Grace.

24 Dr. Anderson eliminates all claimants except those
25 who personally mixed or personally installed Grace asbestos

J&J COURT TRANSCRIBERS, INC.

1 products, as we've heard. Moreover, she does so in an
2 unscientific way, as I will discuss in a moment.

3 Now, Dr. Anderson in turn relies on Dr. Peter Lees,
4 who has computed the asbestos exposure rates for various
5 classes of Grace workers, but remarkably and unscientifically,
6 Dr. Lees does not even report the variations from the averages
7 that he calculates. That's an important point.

8 Now, Dr. Anderson also relies on Dr. Mugavkar. He's
9 the one who's collected the benchmark exposure levels to
10 asbestos that, according to Dr. Anderson, are then necessary to
11 attribute asbestos-related diseases to the exposure. Now, we
12 submit we've argued in our Daubert papers that Dr. Anderson's
13 opinion that only workers who personally mixed or personally
14 installed Grace asbestos products could have been exposed to
15 sufficient levels of asbestos to cause disease. We've argued
16 that that opinion is unreliable and inadmissible.

17 She arrives at this opinion by improperly assuming,
18 Your Honor, that the average asbestos exposure of cohorts in
19 each of the PIQ categories -- those categories that Mr. Bernick
20 referred to, A through F. She assumes that the average
21 exposure of the cohorts in those categories is representative
22 of all workers in that category. She does not account for
23 individual exposure levels at all.

24 So, for example, Dr. R.J. Lees underlying data shows
25 that the average exposure for a worker -- quote, worker -- is

J&J COURT TRANSCRIBERS, INC.

1 much higher than the exposure for a, quote, helper, and that
2 only makes sense, because the worker is more directly working
3 with the product than the helper in the same job category. Yet
4 Dr. Anderson uses the average of the workers and helpers, so
5 that, of course, dilutes the workers' exposure, and by doing
6 this what she does is she eliminates workers even though the
7 average exposures for the workers over 45 years exceed her
8 thresholds.

9 Now to make things worse, she ignores the fact that
10 not all workers in a category have average cumulative exposure.
11 Some have much higher than average cumulative exposures, but
12 she doesn't consider this, which is surprising. If Grace is to
13 be believed that what they're doing here is determining the
14 merits of individual claims on a claim-by-claim basis, then she
15 should be considering these claimants individually and not
16 grouping them and using averages.

17 Now, Your Honor, this is a complicated area of the
18 case. It requires some study. We recommend that the Court
19 carefully read the declarations of Professor Eric Stallard that
20 are attached to the FCR's Daubert papers. Professor Stallard's
21 an expert in demographic risk modeling. In his declarations he
22 explains the importance of accounting for heterogeneity, which
23 is the differences in individual exposures, and he explains how
24 important it is to account for heterogeneity when studying the
25 exposures of individual members of a population, which is what

J&J COURT TRANSCRIBERS, INC.

1 Grace purports to be doing here. Instead, Dr. Anderson's
2 calculating average exposures and ignoring everyone above the
3 average.

4 Now, Professor Stallard also exposes as unscientific
5 and flawed Dr. Anderson's assumption that workers in the same
6 job categories will have, quote, independent exposures. Now,
7 this is a different concept, but it's equally important. So,
8 in other words, she assumes that each day that a worker in one
9 of her groups comes to work, and he has an equal chance of
10 doing any of the jobs in the work category as any other worker
11 just as every flip of a coin has an equal chance of coming up
12 heads as it does coming up tails. That's the independence
13 assumption. So under Dr. Anderson's assumption an exposed
14 worker has an equal chance of doing the job of a helper on any
15 given day, and that's just counterfactual.

16 Dr. Stallard explains why the independence assumption
17 is not scientifically valid, and it's not consistent with
18 accepted scientific practice for the purpose of rejecting
19 individual claims on the premise that they have insufficient
20 exposures to asbestos to cause disease. Your Honor, this is
21 very important. If Dr. Anderson's independence assumption is
22 wrong, then her exclusion of thousands of claimants is wrong,
23 and Dr. Florence's estimate is wildly inaccurate and
24 unreliable.

25 I'd like to talk about Ms. Biggs' methodology. We

J&J COURT TRANSCRIBERS, INC.

1 heard some commentary about it this morning, but let me tell
2 you a little bit about Ms. Biggs. She'll be here to testify,
3 but it may not be until March. She'll be testifying in our
4 case in chief. Can we have that still, Exhibit 8?

5 This is Jenni Biggs. She's a principal of Towers
6 Perrin. It's a leading actuarial firm. She leads the asbestos
7 practice of that firm's Tillinghast Division. Her long list of
8 credentials includes having qualified the potential asbestos
9 liabilities for insurers, for reinsurers, for asbestos
10 defendants. She's the co-author of the Tillinghast study
11 regarding the \$200 billion asbestos universe that was published
12 in 2001. She's chaired the American Academy of Actuaries mass
13 torts working group which created a public policy monograph on
14 the overview of asbestos issues and trends, which was
15 originally published back in Decmeber of '01 and was updated
16 just last summer in August. And she's testified before the
17 Senate Committee on the Judiciary on Asbestos Issues.

18 Now, Grace's attack on her is that, you know, she's
19 unscientific. She hasn't done peer review work. There are no
20 standards governing her work. It's not generally accepted.
21 All those charges are false, and we demonstrated this in our
22 papers, but I'd just like to mention a few reasons why those
23 are false assertions.

24 Her actuarial estimate bares all of the key hallmarks
25 of a reliable methodology that's admissible in federal trials.

J&J COURT TRANSCRIBERS, INC.

1 It's based on published peer reviewed modeling concepts, and
2 you will hear about those. It was prepared in strict
3 compliance with the standards of actuarial science. It's
4 closely related to estimation methodologies that have been
5 accepted by courts in prior estimation proceedings, and it's
6 long been relied on in non-judicial settings by insurers,
7 reinsurers, and solvent asbestos defendants when setting
8 billions of dollars in asbestos reserves. So unlike Dr.
9 Florence's methodology, which was created for litigation and
10 has never been used even by himself outside of litigation, Ms.
11 Biggs' work finds equal place outside the courtroom as it does
12 within, which is one of the criteria and key indicia of
13 reliability under the Paoli decision in the Third Circuit.

14 Can we have Exhibit 9, please? There are standards
15 governing what actuaries do, very specific standards, very
16 exacting standards. This is Casualty Actuarial Society
17 definition of what actuaries do. They're known for their
18 scientific approach and demanding standards,

19 Can I have 10, please? They apply their mathematical
20 expertise, and Ms. Biggs was a math major, and she has a degree
21 in mathematics. Their mathematical expertise, their
22 statistical knowledge, their economic and financial analyses,
23 and problem solving skills to a wide range of business
24 problems. They estimate the costs of uncertain future events.
25 That's what we're here to do. We are here to estimate the cost

J&J COURT TRANSCRIBERS, INC.

1 of uncertain future events. To hear Grace discuss the subject,
2 that's not possible. One can't do that and be scientific.
3 Actuaries would beg to disagree.

4 Can we have 11, please? More importantly, Your
5 Honor, Ms. Biggs' work is governed by the Actuarial Standards
6 of Practice. This is -- or ASOPs to use the acronym.
7 Actuarial Standard of Practice 12 provides that, "An actuary
8 should select risk characteristics that are capable of being
9 objectively determined and based on readily verifiable,
10 observable facts." Ms. Biggs will testify that her estimation
11 methodology complies with these and other ASOPs.

12 Let's go to 13. As we noted -- well, I haven't noted
13 it yet, so I'll note it for the first time, Ms. Biggs' estimate
14 of the liability in this case -- her best estimate is \$3.8
15 billion discounted. How did she arrive at that figure? Grace
16 claims that he made a bunch of ad hoc judgments, and that her
17 estimate is the product of assertion and not scientific
18 analysis. That's from their brief -- their reply brief at Page
19 32.

20 Well, let's review what she did. She has a six-step
21 methodology following a peer reviewed actuarial model. You
22 heard Mr. Bernick make reference to the peer reviewed basis for
23 the model this morning in his opening. This is the peer
24 reviewed methodology she followed. Step 1 was to compile basic
25 claims information, and she started with Grace's own CMS

J&J COURT TRANSCRIBERS, INC.

1 historical data base, which Grace developed in the 1980s and
2 has used it throughout the years to track the hundreds of
3 thousands of personal injury claims. This is actual historic
4 data.

5 Next, please. What she first had to do was there
6 were all these disease categories in CMS. She consolidated all
7 the non-malignant claims down to one category of non-malignant
8 which left her with seven categories of disease types.
9 Ultimately, that gets reduced to four, as we'll see in a
10 moment.

11 Next, please. But what she found was that in CMS
12 there were many, many missing records. For some claimants
13 social security numbers were missing. For many, many claimants
14 disease information was missing. So rather than be content
15 with less than a robust database to use at the jumping off
16 point for her estimation, she went to the Manville database
17 and matched claimant by claimant, a very meticulous process of
18 bringing over the information that was not in CMS to fill out
19 the data on these claimants. And along the way she made many
20 conservative assumptions and selections. Grace refers to them
21 as ad hoc judgments. She had to make judgments about how to do
22 this, and I think you'll hear that in many more cases than not
23 she took the most conservative judgment that would enure to
24 Grace's benefit and to her client.

25 To fill in some of these other holes, she looked at

J&J COURT TRANSCRIBERS, INC.

1 the PIQ POC database and match further to that. And at the end
2 of the process she came up with one complete data set of
3 claims.

4 Let's go to Step 2. And that completed her
5 compilation of basic claims information. The next step was to
6 estimate future claim filings. This is a chart with respect to
7 mesothelioma future claim filings. This graph shows the number
8 of mesothelioma claims that were filed along -- and on the
9 vertical axis the number and then the years in which they were
10 filed. The upper line is Ms. Biggs' industry benchmark which
11 is based on research that -- and data from Tillinghast. Mr.
12 Bernick said this morning that there's no company data in the
13 Biggs and Peterson models, and I think with respect to Biggs,
14 he was referring to this industry benchmark data. Well, that's
15 just false.

16 The Biggs industry benchmark derives from corporate
17 defendant disclosures, from SEC filings, from Tillinghast
18 confidential client data, and various public information such
19 as the en banc database, which is itself a collection of data
20 gathered from courthouses all over the country on the number of
21 claims that are being filed, and that is truly representative
22 of what's happening to the industry. So the industry benchmark
23 is a compilation of what's happening outside the world of
24 Grace. She also looks at Grace's actual filings over a
25 historical period.

J&J COURT TRANSCRIBERS, INC.

1 Now note this shaded area here between 1997 and 2001.
2 Starting with roughly 1997, Grace had moratorium agreements
3 with various plaintiffs' firms. Certain plaintiffs' firms in
4 exchange for group settlements were agreeing not to sue Grace
5 for a certain period of time. This tended to dampen the number
6 of filings in the late 1990s, as you can see here. And then,
7 of course, the claim filings go up in 2000, as Mr. Bernick
8 explained.

9 Next slide, please. These are the moratorium
10 agreements that expired in 1999 that are highlighted in yellow.
11 You can see how many there were. Where now these firms are
12 backing the business, theoretically at least, of suing Grace.
13 And so, of course, it stands to reason that once these
14 moratorium agreements end we see an upswing in claims against
15 Grace.

16 Mr. Bernick asked rhetorically why Ms. Biggs has
17 selected 1997 -- strike that. Let's go to the next slide,
18 please. There's a calibration period here that Ms. Biggs uses
19 for purposes of her estimate of future claim filings. The
20 calibration period is '97 to 2001. Mr. Bernick said it was an
21 arbitrary choice that she made to use those years, and it
22 reflects selection bias is what he said. Well, that's not true
23 either. She chose that period to account for the aberrations
24 in the annual ratios of claims that were filed due to the
25 moratorium agreements that Grace had with these plaintiffs'

J&J COURT TRANSCRIBERS, INC.

1 firms which tended to understate claim filings in the late
2 nineties but then led to a surge of claim filings in 2000 and
3 2001. So to correct for the annual aberrations she selected
4 shares based on the '97 to 2001 calibration period.

5 Interestingly, Your Honor, when she testifies here,
6 you can ask her if she had gone back to 1992 and used the
7 calibration period from '92 to 2001. Let's go to the next
8 slide, please, Tom. One more. She calculates ultimately that
9 Grace had 58.4 percent of the total industry claim filing
10 experience. In other words, more than half of the claims that
11 are being filed are included in Grace. If she had used her
12 calibration period going back to 1992, it would -- Grace's
13 share would still be something north of 50 percent -- in the
14 low fifties somewhere.

15 Okay. Let's go to the next slide, please. Okay.
16 Let's go further. I'm trying to get to the next step after
17 she's estimated the future claim filings showing Grace's share
18 in comparison to the industry benchmark and Grace actual. One
19 more. She has to look at -- she has to estimate the data first
20 exposure. Well, she has to factor in the data first exposure
21 and use the decay rates that Mr. Bernick mentioned that were
22 given to her by Professor Stallard. And but this series of
23 graphs shows -- and we'll go through these quickly, Tom -- is
24 that because Grace was introducing asbestos products later than
25 most other defendants and these years reflect when people are

J&J COURT TRANSCRIBERS, INC.

1 being exposed to asbestos -- and you can see that the later the
2 exposure, the later the claims are being filed in time, and
3 that they don't run off until around 2059, according to Mr. --
4 Professor Stallard.

5 Next one, please. This is their total industry, and
6 you can see the shape of the curve on the run off that Stallard
7 has calculated.

8 Next. And this is Grace's share. Note how this
9 difference between the green and the blue gets narrower as we
10 go forward in time. And this is showing how Grace's later
11 dates of first exposure are producing claims against it in the
12 future for much longer than the rest of the industry.

13 Let's go to Step 3. She's got to now estimate claim
14 dismissals. Obviously, Grace isn't going to be expected to pay
15 every claim. They didn't pay every claim in the past. They're
16 not expected to pay every claim in the future. Ms. Biggs
17 calculates dismissal rates for non-malignant and malignant
18 claims separately, and she does it by jurisdiction. She uses
19 the jurisdiction's medical criteria. She looks at judicial
20 legislative changes to such criteria and Grace's actual history
21 of claims resolution. For malignant claims, she starts with
22 historical dismissal rates by disease and by jurisdiction.

23 Next. And she assumes that the same dismissal rates
24 will apply in the future. In other words, there's nothing in
25 the changes in the legal system that are going to cause Grace

J&J COURT TRANSCRIBERS, INC.

1 to dismiss or not pay more malignant claims in the future than
2 they did in the past. Now, it's a different story with non-
3 malignant claims. In the past Grace was dismissing a small
4 percentage of those claims. Ms. Biggs has calculated and
5 determined that in the future going forward Grace's dismissal
6 rate on non-malignant claims is going to be much higher. For
7 example, in the State of Mississippi Ms. Biggs assumes that the
8 dismissal rate for non-malignant future claims will be 99
9 percent after 2004. So that's Step 3.

10 Step 4 is to calculate the average payment values.
11 What she does here, as with her dismissal rates, she calculates
12 average payment -- value payments by disease type and
13 jurisdiction. She starts with the historical values that Grace
14 was paying, and then she considers factors that are expected to
15 either increase or decrease those values over time.

16 Now, Mr. Bernick -- and, of course, these are shown
17 here on this chart, historical trends, increases in plaintiff
18 demands, and so forth. Decreases, tort system changes, she's
19 factoring in the lack of a broken tort system and claimant
20 aging. Now, Mr. Bernick displayed some charts this morning
21 showing mesothelioma claim values and how those have been
22 trending recently. An example was the one at Page 57 of the
23 slide copies that Your Honor handed up -- were handed up to
24 Your Honor by Mr. Bernick. That's the one that says Peterson
25 Mesothelioma Settlement Values.

J&J COURT TRANSCRIBERS, INC.

1 One line of that chart shows the average settlement
2 value of confidential companies studied by Dr. Dunbar, and it
3 shows a downward trend over the last few years. Well, but Ms.
4 Biggs has confidential client data as well. If I can switch --
5 could I switch to the ELMO for a minute? Is that possible?

6 (Pause)

7 MR. MULLADY: Okay. This is a little bit hard to
8 read on the screen, Your Honor. I apologize for that. I'll
9 see if I can make it clearer.

10 The three different examples that are provided by Ms.
11 Biggs -- is that going to work? Yea -- here, Example 1,
12 Example 2, Example 3, there's actual Grace, and then there is
13 selected Grace. And what is this -- what does this -- what is
14 this telling us? Well, it's telling us that of the
15 confidential company data Ms. Biggs studied what we see here is
16 far from falling off a ledge in terms of values the way Mr.
17 Bernick claims the data show. There are some defendants here
18 that actually experienced increases recently. This little
19 spike here and another one right here, those are upward
20 trending values for mesothelioma claims.

21 And Grace is down here. Her assumption for Grace is
22 this green line, selected Grace here. So I think you'll see
23 when she comes here that she's made very conservative judgments
24 about the values of mesothelioma claims. It's consistent with
25 the data that she has, and, obviously, there's a little bit of

J&J COURT TRANSCRIBERS, INC.

1 a dispute here' between Dr. Dunbar and Ms. Biggs about what the
2 confidential company data is showing on mesothelioma values.
3 But there's no denying, from the chart that Mr. Finch showed
4 the Court this morning, that mesothelioma values have been
5 going up for some time.

6 The last step -- if we can go back to the regular
7 screen? Take this down. There are two more little steps in
8 her calculations. Step 5 of her methodology --

9 (Pause)

10 MR. MULLADY: Step 5 is where she calculates the
11 future and pending claim liability. She does this by year.
12 We're showing 2002 just as an example. She takes the number of
13 claims estimated for that year. She then eliminates claims
14 based on her calculated dismissal rates by disease type and by
15 jurisdiction.

16 Next, please. And that leaves the claims on which
17 Grace would be liable to pay or the claims to pay. And she
18 next averages or applies the average payment value that was
19 calculated for the year in question, and she multiplies the two
20 variables, the claims to pay by the average payment to get to
21 the total liability.

22 Next. She does this for each and every year of
23 Grace's future liability, all the way to 2059. We won't show
24 every year.

25 Next, please. Resulting in -- no, I'm sorry. We

J&J COURT TRANSCRIBERS, INC.

1 have to go back just to -- we got a little ahead of ourselves.
2 Should have -- okay. One more. Is that it? Okay. That's
3 Step 5.

4 Step 6 is to calculate the cash flow. Grace's total
5 liability showing here on an undiscounted basis of 8.9 billion.
6 And based on the general time value of money principal, Ms.
7 Biggs applied a 5.25 discount rate to all future cash flows for
8 each year. This process yields -- and this is again showing it
9 year by year and how it works. This process yields a total
10 discounted liability for all asbestos claims of \$3.8 billion.

11 The \$3.8 billion -- if we can go to the next slide --
12 is broken out in this table by four disease categories that Ms.
13 Biggs reduced her claim matching to as set forth in these
14 column headers. And you'll note -- if we can bring up the next
15 image? You'll note, Your Honor, that 68 percent of the total
16 discounted liability of Grace, some 2.6 billion of the \$3.8
17 billion is for mesothelioma liability. This is why Mr. Bernick
18 said this morning all of his slides focus on mesothelioma for
19 this reason right here. That number alone, that \$2.6 billion,
20 is five times higher than Dr. Florence's estimate for all
21 claims, for all disease categories combined.

22 That's the magnitude of the difference in the
23 estimated liability that Grace seeks to impose through its
24 methodology. That difference overwhelmingly impacts the future
25 claimants. Thank you, Your Honor.

J&J COURT TRANSCRIBERS, INC.

1 THE COURT: Mr. Bernick.

2 (Pause)

3 MR. BERNICK: Your Honor, I'm going to proceed in
4 reverse order and begin with the remarks that Mr. Mullady made
5 on behalf of the Futures Representative, and I'm just going to
6 go through the -- pretty much that sequence, but I want to make
7 sure that I return back to some of the legal questions that
8 Mr. --

9 (Pause)

10 MR. BERNICK: How about that? Is that better?
11 Because I agree with Mr. -- Mr. Lockwood that, in fact, the
12 legal issues are very dominant issues and warrant the Court's
13 attention, because they drive an awful lot of what then appears
14 in the -- in the detail alone.

15 With respect to Ms. Biggs, the observation was made
16 that this is an analysis or a method that's not done for
17 litigation purposes like Mr. Florence's method is. And, in
18 fact, we would submit, Your Honor, that the shoe is on the
19 other foot. That Mr. Peterson's methodology, which, after all,
20 is actually prior in time to the Tillinghast methodology and
21 set the model, in fact, was developed principally for
22 litigation purposes that isn't the context of disputes or
23 confirmations in court per claim.

24 Whereas, Dr. Florence's approach is not Dr.
25 Florence's approach. That is a mistake that is made frequently

J&J COURT TRANSCRIBERS, INC.

1 -- has been made frequently in the remarks here this afternoon.
2 Dr. Florence was the person who implemented the approach in
3 terms of looking at the data that satisfies the criteria that
4 were set by the scientists, which criteria are, in fact, the
5 criteria of science. That is what hasn't been developed in the
6 courtroom.

7 There's a criteria of science that are dominant and
8 authoritative outside the courtroom and structures the entirety
9 of Grace's approach, whereas, if you look for those same
10 principles and criteria or the same analysis with respect to
11 the plaintiffs' estimation, it is not to be found. Mr. Mullady
12 says that, well, gee, actuarial standards were designed to deal
13 with uncertain future events. We would recognize that that's
14 true. It just is a problem and a problem that's fundamental to
15 Ms. Biggs' analysis that in her case neither modeled nor
16 addressed future liability issues, that is legal liability
17 issues, nor was she qualified to develop such a model, nor does
18 she have a model, in fact, that even looks to the future events
19 that she purports to measure, which are not liability issues
20 but settlement activities in a way that follows the rule of
21 science.

22 The actuarial standard is read and is was very, very
23 clear. It's general. It gives broad permission. The issue is
24 whether that method -- those standards, as applied in this
25 conduct -- context, meet the testing requirements of science.

J&J COURT TRANSCRIBERS, INC.

1 She says she's -- she was attempting to be a scientist. Dr.
2 Stallard says the same thing. If you are going to measure
3 either settlements or future disease, you have to do so
4 scientifically. The actuarials do not forgive you from
5 following science. They permit you to follow science.

6 With respect to peer review, reference was made to
7 peer review, and again there has been no external peer review
8 of the model that you will hear about from Ms. Biggs. The only
9 article that was made reference to is an older article. The
10 older article -- if we could have the ELMO for just a second?
11 It's right here. It's revealing, because when it comes to the
12 model that's being used -- it's hard to read here, but the
13 model that's being used simply uses selected annual severity
14 trends and trend severity, and it's basically arithmetic. That
15 trend were -- nowhere considers under this article any of the
16 elements of her model, nowhere considers an industry benchmark,
17 nowhere considers epidemiological trends of any kind, nowhere
18 considers Manville, nowhere considers propensity. All it does
19 is to look for a trend -- a very general trend. This paper in
20 no way, shape, or form even reveals publicly what her model was
21 much less constitutes a peer review.

22 Mr. Mullady sought to correct the statement that I
23 made where I indicated that Ms. Biggs' were -- her propensity
24 were -- was not based upon public companies but rather the
25 Manville Trust. Mr. Mullady says, well, the industry benchmark

J&J COURT TRANSCRIBERS, INC.

1 did consider other companies. Yes, it's true. With respect to
2 the historical industry benchmark, that was based upon Manville
3 and other companies. The key is what is the future trend, and
4 when it comes to the future trend, the future trend that drives
5 this curve that is at issue, that curve -- the shape of that
6 curve is purely and simply a function of the Manville trust
7 taken first as a smooth process then as a (indiscernible) then
8 as a decay process never before seen the light of day.

9 There was reference made to the moratorium agreement
10 by way of explaining why the propensity of rates may have
11 shifted. Ms. Biggs did talk about that in her deposition and
12 report. She did no quantitative analysis that demonstrate that
13 the dip that took place in propensity or the spike was in any
14 way, shape, or form actually a function of the moratorium
15 agreement experiment. She simply said it and didn't do the
16 analysis. Dr. Dunbar did do the analysis. The analysis shows
17 that that theory is false.

18 With respect to the selection of 1997 as the period
19 for calibration, that was purely and simply her judgment.
20 There was no statistical testing. She didn't pick it out in
21 order to put boundaries on moratoria. She picked it out to out
22 balance in some rough fashion the fact that there was this huge
23 aberrational spike. But, of course, it wasn't sufficient to do
24 that. She says or Mr. Mullady says that the date of first
25 exposure analysis indicates that because Grace products were

J&J COURT TRANSCRIBERS, INC.

1 later in exposure, the whole curve should be shifted all the
2 way out to 2049. In fact, according to the Nicholson analysis,
3 which drives Dr. Peterson's work, the continuing resonance of
4 the alleged date of first refusal -- first exposure requirement
5 should end about 2027 not 2049.

6 There's reference made to confidentiality -- this
7 confidential client data. It's true that we knew it was
8 confidential client data, but what's different about our
9 analysis is that the confidential client data has actually a
10 deploy of curves. She looks at confidential client information
11 and then doesn't deploy the curves. She uses rather the
12 propensity, which is based upon the Manville analysis. And
13 further, our confidential client information is then confirmed
14 and verified by publicly available information from both the
15 SEC filings and the very prominently important solvent
16 continuing companies in the tort system.

17 That then brings me to Union Carbide. There was a
18 statement that was made with respect to Union Carbide. Yes,
19 Union Carbide was considered by Dr. Peterson, maybe even been
20 considered by Ms. Biggs, but only as of 2001 neither one of
21 these individuals had taken the most solvent company still in
22 the tort system and actually plotted what its experience is.
23 We had to bring that out on cross examination of their expert.
24 It turns out that the Carbide experience is going down. The
25 bubble is -- the bubble has burst.

J&J COURT TRANSCRIBERS, INC.

1 Finally with respect to the analysis of Ms. Biggs, it
2 was pointed out at great length in connection with her -- at
3 great length it was pointed out by Mr. Mullady that somehow
4 there's a due process problem in any effort to some of the
5 assigned future values or future demands at zero value is a due
6 process problem, but yet his own expert by his own admission --
7 that's what the graphics indicated -- basically takes people
8 out of the equation, and there's a reason for it. Due process
9 does not require that you over fund or give people rights that
10 they don't have, give them values that they don't have. Due
11 process requires -- is a procedural requirement. It doesn't
12 actually indicate that you must come up with a value in any
13 way, shape or form.

14 Talking about Ms. Anderson, a reference was made
15 that Ms. Anderson uses an average rather than an accounting or
16 individual variation than the concentrations that individual
17 workers might experience, and, in fact, Ms. Anderson did use an
18 arithmetic mean, and the real issue is did that introduce bias.
19 That is because she used an arithmetic method that contemplates
20 that there will be elements -- there will data on both sides,
21 but the mean is still representative if you have an appropriate
22 distribution. The statement was made this is counterfactual.
23 That there are people who, in fact, have higher exposures and
24 lower exposures. The interesting thing is that's a statement
25 that's made by Mr. Stallard not on the basis of anything.

J&J COURT TRANSCRIBERS, INC.

1 There's not a single data point -- there's not a single
2 distribution analysis that's been done by the other side at
3 all. This is simply a theory. It's not counterfactual. This
4 is, in fact, the way things are done. They don't have data
5 that says otherwise. In fact, the EPA actually and clearly
6 said that the average concentration is the most representative.
7 This is an EPA publication, 1992. This is standard affairs,
8 standard approach. The EPA uses it all the time. Dr. Anderson
9 worked for the EPA. It then turns out that, of course, Dr.
10 Stallard did not.

11 Finally with respect to remarks that were made by Mr.
12 Mullady. He says that we assign no value to the future -- to
13 certain futures as if, of course, all futures must have some
14 value. There's no requirement in the Code that all futures
15 must get some value. The only requirement in the Code is that
16 futures be treated in the same fashion as the currents. So
17 whatever the appropriate treatment is for the currents, that is
18 the entitlement of the futures. They're not entitled to any
19 less, and they're not entitled to any more.

20 And that then brings me to the game board, and all
21 I've got to say about the game board is -- that's the wrong
22 board. It's the wrong game. That board describes nothing that
23 we're doing in this case. We are not doing anything that says
24 with respect to futures you can't get this, you can't get that,
25 you must file this, you must file that. That will be

J&J COURT TRANSCRIBERS, INC.

1 determined by a plan. The plan will spell that out within the
2 limits of the law. In fact, the plan that's on file doesn't
3 actually hamstring the treatment of the futures in any way.
4 What it says is that futures will not be obliged to settle or
5 to litigate. They will have an option. Current claimants will
6 not be obliged to settle or litigate. They will have an
7 option. So no criteria are being imposed upon them in advance.
8 If they want to, just like the current claimants today, they
9 can litigate. That is entirely within the purpose and intent
10 of the Code.

11 That then brings me to remarks that were made by Mr.
12 Finch, and I will be brief with respect to Mr. Finch, because I
13 do only have a couple minutes to talk about the law. With
14 respect to Mr. Finch, he says, well, now, Dr. Peterson, we said
15 that there weren't more claimants, but, in fact, there were
16 more claimants coming into the system. We never said that
17 there weren't more claimants. What we said is that you can't
18 account for the increaed propensity against Grace by new people
19 coming into the system. You can only count for them by having
20 -- that is magnitude in spike by the same number of existing
21 claimants actually proceeding against Grace and other companies
22 that they wouldn't have been proceeding before. It's the whole
23 idea of the same basic number, maybe slightly increased,
24 increesing the number of people that they sue thereby driving
25 up the propensity of all the defendants.

J&J COURT TRANSCRIBERS, INC.

1 Mr. Finch indicated, well, we used Johns Manville,
2 because Manville gets 90 to 100 percent of the cases. That's
3 the whole problem. They're treating Grace as if Grace is
4 liable for all of Manville's liability. Manville accepts
5 liability for all products, not just Grace, for everybody. So
6 by treating Grace the same way as Manville, we are treating --
7 they are treating Grace as if it's responsible for the asbestos
8 liability stemming from any exposure whatsoever.

9 Mr. Finch says, well, we did look at other -- Dr.
10 Peterson did look at other companies. USG and Turner and
11 Newell as of 2001. Well, that's interesting. USG was on the
12 verge of bankruptcy in 2001. Turner and Newell through
13 Federal-Mogul was on the bridge of bankruptcy in 2001. What
14 about companies after 2001? Dr. Peterson didn't consider a
15 single company after 2001. All he considered was the Manville
16 Trust.

17 Union Carbide in 2001 -- Union Carbide was -- had
18 just been basically targeted by the plaintiffs' bar. Their
19 propensity was skyrocketing. What about Union Carbide in '03,
20 '04, and '05 when they got control of their litigation, and the
21 propensity against them fell like a stone? Nowhere considered
22 by Dr. Peterson.

23 What about Grace? Mr. Finch says, well, late in 2006
24 insurance executives at W.R. Grace actually sent the Peterson
25 report to the insurance companies, thereby indicating, oh,

J&J COURT TRANSCRIBERS, INC.

1 well, I guess we're signing on to Dr. Peterson for purposes of
2 the insurance reserves. That's completely false.

3 That memo, which we will show to the Court, actually
4 said in exactly the same breath here's so and so. Here are
5 some of the Peterson reports. You can follow on the rest of
6 the exhibits on bankruptcy filings along with all of the other
7 expert reports. He's simply saying, you want this stuff? It's
8 here. You can take a look at it. We want our money from you.
9 Yes, actually, it says, "I can copy the Peterson report
10 approximately (indiscernible), or you can find the report and
11 all other filings on the Grace bankruptcy on the Delaware
12 Bankruptcy Court's website."

13 That then brings me to Mr. Lockwood, and I think Mr.
14 Lockwood has raised some -- an interesting analysis of the law,
15 and I think actually the track that he traces through some of
16 the law, I would agree with a lot. It's just that like their
17 model it deviates at just all the critical parts. He indicates
18 that with respect to these companies, well, why -- you know,
19 it's just crazy. Is this some bright idea? No, the companies
20 have had different perspectives. Armstrong World Industries
21 never set out on the road with these cases to define or resolve
22 through some definition what its liability was. The company
23 made a deliberate decision at the very beginning of the case
24 just for peace and to get the case behind them in part because
25 they didn't believe that their liability picture was such that

J&J COURT TRANSCRIBERS, INC.

1 it would make a difference (indiscernible) liability. Owens-
2 Corning, same thing. The -- Owens-Corning had done deals with
3 the claimants bar going back to the mid-1990s. They were never
4 going to go into Chapter 11 to dispute liability. Federal-
5 Mogul was so swamped with so many other liability problems, the
6 asbestos problem would've made a difference.

7 By contrast, USG and Grace -- USG and Grace are two
8 companies that were very robust companies, very solvent
9 companies, and very well high performing companies but for the
10 asbestos. It is not surprise that USG and Grace then decided
11 to go forward and try to use the Chapter 11 to define and
12 resolve the liabilities. USG emerged, God bless them, with
13 very, very significant equity after lots of protestations from
14 Dr. Peterson. USG emerged following an effort to define its
15 liabilities, and we know Judge Wolin's opinion in connection
16 with (indiscernible). Grace is going down the same road.

17 Mr. Lockwood then says, well, what then is the
18 authority that we have for this idea. He cites Dow-Corning and
19 Dow-Corning actually provides a very instructive lesson that
20 I'll cover very briefly. It is true that both sides there
21 asked for an estimation. It is true that Judge Spector there
22 decided no, and that he decided no, because he felt that the
23 most appropriate way to deal with this issue was through actual
24 litigation of the allowance process. He also did, in fact,
25 decide, as Mr. Lockwood indicates, that that litigation would

J&J COURT TRANSCRIBERS, INC.

1 turn out common issues, and, therefore, it deployed a Rule 42.
2 And it's also true that he didn't decide that, but then it kind
3 of trailed off. He just didn't do it, and that really misses
4 the picture of the key part of Dow-Corning, which is he decided
5 that that would be handled -- best handled by the District
6 Court, in part because the District Court was also handling the
7 Dow Chemical cases that had been transferred to the District
8 Court -- the shareholder cases.

9 Elsewhere in the MDL where proceedings were under way
10 against other (indiscernible) manufacturers, there was a 706
11 panel that had been empaneled. So there was a likelihood that
12 at some the District Court sitting in connection with the Dow
13 Chemical cases would take up exactly the same issue, and for
14 that reason he felt it was appropriate to send the whole thing
15 upstairs, which he did. And then the motions for summary
16 judgment based on Daubert were pending before the District
17 Court. Indeed, I argued them to the District Court, and at
18 that time, because what the 706 panel did -- prices came down
19 in the marketplace. There was a big push by the claimants to
20 reduce their demands, and the case resolved. The plan also
21 wasn't struck.

22 So what do we see from Dow-Corning? Number one, the
23 allowance and disallowance process focuses on the merits.
24 Number two, estimation focuses on the merits. It doesn't focus
25 on anything else. They're birds of the same kind of feathers.

J&J COURT TRANSCRIBERS, INC.

1 Different procedures. The same focus, which is the merits.
2 Mass tort is amenable to be handled pursuant to those kinds of
3 procedures. Common issues work particularly on generic
4 causation, although there's nothing there that says it can't be
5 used for what I'll call common issues that affect the specific
6 causation.

7 So Dow-Corning takes us way down the road saying it's
8 the merits, merits, merits, whether it's estimation or
9 allowance. It also helps, Dow-Corning indicates, that you
10 focus on the merits in order to get plan resolution, in order
11 to get consensus, because it helps focus the controversy and
12 what real liability is.

13 Dow-Corning also supplies the answer to the other
14 basic question that Mr. Lockwood raised. That basic question
15 is, well, what are we doing here. He says here there's no
16 agreement. That's correct. Here, because there's no
17 agreement, the question that we impose is what's the legal
18 liability. That is what can we be obliged to pay? Yes, that's
19 right. And your answer to that -- that's our position. I
20 didn't hear an answer to that. He then says our view is that
21 502(b) governs, because that deals with allowance. We said
22 yes, we believe that's right, because it tells us what the
23 standard is. We didn't hear an answer to the 502(b) analysis.

24 He then says, well, there are a bunch of mechanisms
25 that we put in place, bar date, PIQ, experts. Yes, those are

J&J COURT TRANSCRIBERS, INC.

1 all mechanisms that are designed to focus on the merits,
2 traditional litigation. Didn't hear any question about that
3 those are not the traditional methods that are used in
4 discovery and litigation. The only criticism we heard is that
5 none of our experts is a lawyer. Well, they don't have to be
6 lawyers. We are the ones that are telling them here's the
7 issue. It's then their job to find out the scientific answer
8 to that issue. Dr. Florence doesn't have to be a lawyer, and
9 we don't have to bring in a whole set of lawyers like Mr.
10 Snyder ot tell us what the stsandard is that ought to govern
11 science, because we're all lawyers. We're capable and the
12 Court's capable of understanding the standards of the law to
13 which the science must fit.

14 Where is Grace going with its number? That was the
15 next question that was posed. The answer is very simple. Just
16 as Your Honor indicated, Grace is going with its number towards
17 the plan formulation -- plan formulation. What plan? Well, we
18 have a plan on file, but we've been candid that that plan could
19 be revised. We hope that their plan would also be revised.
20 What will that plan call for? We'll see. That's not before
21 the Court here.

22 However, Mr. Lockwood, inviting scrutiny down the
23 road and kind of looking (indiscernible) and says, well, it's
24 clear right now. There can only be two alternatives. Either
25 the criteria are baked into the TDP of the trust, or if they're

J&J COURT TRANSCRIBERS, INC.

1 not, more is paid, and the trust runs out of money. He said I
2 can't think of another alternative.

3 There is another alternative. You don't have to bake
4 the criteria into the TDP. You can use the criteria in order
5 to have a TDP that says if people want to settle it on the
6 basis of those criteria and pricing, that's an option. And if
7 people do not want to settle, they are still free to litigate
8 their claims. And that's an option that is clearly out there.
9 You know what? That's exactly what the Dow-Corning plan did.
10 It set out the criteria. It says you can go in, you can buy
11 in, you can settle, or you can litigate. Here's the case
12 management order. It will all take place in Federal Court
13 pursuant to rules that are applicable in Federal Court. That
14 was the one that was approved over objection. That's the one
15 that's now in place, and I'm happy to tell the Court, as Mr.
16 Austern will be able to attest, that over, over, overwhelmingly
17 the Dow-Corning claimants are not opting for litigation.
18 They're opting for settlement, and the trust has been a
19 successful trust.

20 Will there be a cap? There may be a cap. If there
21 is a cap, the Code nowhere says we can't have a cap, but it
22 does say that we would have to raise that issue with the
23 District Court. We are not raising that issue now. We are
24 trying to get the estimate out, so we can get a plan.

25 Very, very quickly a couple of other points, and I'm

J&J COURT TRANSCRIBERS, INC.

1 done. Daubert. Two uses of Daubert. Mr. Lockwood says, well,
2 gee, what we using it for? Number one, it is a threshold
3 requirement to have any of the testimony that comes in on
4 estimation satisfy Daubert. Regardless of what the claims are,
5 you can't do the estimate unless the estimate is done
6 scientifically. Obviously, it is our view that they don't
7 satisfy the requirements of Daubert, because they don't follow
8 in a reliable methodology. They disagree. That's issue one.

9 Issue two is, well, what would happen if the cases
10 were litigated pursuant to the requirements of Daubert? That
11 is in a follow on litigation process in Federal Court, which
12 ones would survive? Again, the totally legitimate use, but we
13 do not seek to preclude those claims on that basis.

14 What about Rule 408? Again there was reference to
15 the Babcock case. The holding of Babcock was that in taking a
16 look at what the past liability was at the time of an alleged
17 fraudulent conveyance you could use the co-temporaneous
18 assessments of settlement liability to determine what it was in
19 that contest is past liability. You could use past
20 settlements.

21 Here we're talking about something else, which is
22 using past settlements to say here's what the future disputed
23 liability is. That is not what happened in the Babcock case,
24 never spoke to it. Indeed very specifically Judge Brown said
25 nothing that I'm doing in this opinion speaks to the question

1 of what kind of estimates or what kind of liability
2 determinations will be made at a later stage in this case.
3 There was an indication that somehow the Judge -- Judge Vance
4 rejected the position that we're arguing for here saying it
5 just wasn't feasible. I don't know. I was in that case, and
6 that's not what Judge Vance did.

7 All of those objections were made in advance. Mr.
8 Inselbrook stood up and gave a passionate speech about how it
9 was infeasible, couldn't be done, and she decided through the
10 bar date anyhow, and she decided through the claim forms
11 anyhow. What happened was we then litigated fraudulent
12 conveyance. We didn't litigate the motions for summary
13 judgment. Litigation for fraudulent conveyances took place.
14 We were fortunate in prevailing. The company then wanted to
15 seek a resolution instead of seeking out how long it would take
16 in court. The Judge never ruled on the pending motions, never
17 said that they were not viable, but the settlement process took
18 over. In fact, I'm sure that Mr. Inselbrook would applaud.

19 Finally, asbestos -- asbestosis not necessary. This
20 is a point made by Mr. Finch. Asbestosis is not necessary, and
21 this is the point. For those people, either have asbestosis by
22 radiograph or by pathology, it is true pathology is another way
23 to go. We specifically looked to see if there were a lot of
24 pathology samples. There are very, very few. So
25 overwhelmingly the alternative is x-ray. That's why we focused

J&J COURT TRANSCRIBERS, INC.

1 on x-ray to determine whether the information that was coming
2 from the B readers was sufficiently reliable to be -- pass the
3 Daubert standard.

4 A statement that was made that Mr. Dunbar somehow
5 does estimation their way, Mr. Dunbar has on occasion done
6 estimation their way when the inputs that are available require
7 it. But when the inputs are different, estimations can be done
8 in different ways depending upon the issues that are posed.
9 And Mr. Dunbar is fully on board with this case with how this
10 case is run.

11 Finally with respect to Rule 702, Mr. Finch says you
12 don't have to do science under 702. Well, that's true. If you
13 don't purport to be doing science, 702 doesn't apply. They
14 purport to be doing science. Every single one of their experts
15 says I am doing science, and when you purport to do science,
16 you've got to do it.

17 They say, well, these methods are used not only
18 inside the litigation process, but they're also used outside.
19 And it's true, that would be a consideration, but it's a
20 minimum consideration. That is if you don't even live up to
21 the standards that you have outside with what you're doing
22 inside, you've got a problem. But just because you bring into
23 the courtroom a purported method that you use outside doesn't
24 mean that it somehow satisfies the Daubert standard.
25 Otherwise, if it's junky outside, it qualifies inside. So it

1 has to be at least as good.

2 In the same fashion acceptance is important. It
3 should be accepted, but the mere fact of acceptance doesn't
4 make it right. The key thing is what are the standards for
5 science outside and inside, the standards, and there the
6 standards articulated by their own experts focus on
7 predictability, focus on reliability, focus on being data
8 driven, and they flunk those standards. Again, there is no
9 data in this case -- no testimony in this case that these
10 methodologies had been shown to have any predictive value with
11 respect to a company still in the tort system. Thank you, Your
12 Honor, for indulging us here this afternoon.

13 THE COURT: Mr. Lockwood. Mr. Bernick, if you need
14 to leave, you may leave. I know that the debtor still has
15 other people here, so you -- if you need to go --

16 MR. LOCKWOOD: He's finished --

17 MR. BERNICK: Well, I'm mindful of our time limits,
18 and I will --

19 MR. LOCKWOOD: According to the agreement he's
20 finished anyway, Your Honor. You've got a main and a reply and
21 then you're done, so --

22 MR. BERNICK: But under the agreement they also used
23 up all of their time.

24 MR. LOCKWOOD: We did not. We have --

25 MR. BERNICK: Well, I think that that's --

J&J COURT TRANSCRIBERS, INC.

1 MR. LOCKWOOD: -- at least 20 minutes left.

2 MR. BERNICK: Well, now see this is another -- this
3 is a problem we're having, Your Honor.

4 THE COURT: I think by my calculation you actually
5 have ten, Mr. Lockwood.

6 MR. LOCKWOOD: Okay. Well, I'll take less than ten.
7 First, Mr. Bernick said that -- he recited his agreement with
8 me that, yea, they were insisting that their legal liability be
9 determined, and yea, they were relying on 502(b), and he says
10 we didn't have an answer to that. Either he wasn't listening,
11 or I guess maybe I didn't make myself clear. We do have an
12 answer for that. Those are the tests for the allowance or
13 disallowance of claims, and that's not what is going on here.
14 That's the answer. Five 0 two (b) is irrelevant. Legal
15 liability is not the issue.

16 When discussing the issue of what the purpose of this
17 estimation is all about, Mr. Bernick's explanation was it's
18 about, quote, plan formulation, close quote. Apparently, his
19 idea is that the parties in this case can come to a bankruptcy
20 judge and put on an 18-day trial for the purpose of the judge
21 giving him hints about what they ought to put in their plan.
22 I'm not aware of anything in the Bankruptcy Code that suggests
23 that that is an appropriate subject for a contested matter.
24 They've got a plan. They formulated the plan. If they think
25 it's got defects in it, they can change the plan. When we get

J&J COURT TRANSCRIBERS, INC.

1 the confirmation, if the Court says their plan isn't
2 confirmable, they can withdraw it and put in a new plan that
3 is. Ditto for us. That's the way it works. We don't go out
4 and ask people for advice -- bankruptcy courts for advisory
5 opinions about how we ought to go about drafting plans that
6 meet confirmation standards.

7 Apparently, he's so into advisory opinions that his
8 -- he wants to characterize Judge Brown's ruling on his 408
9 argument as an advisory opinion, because he says Judge Brown
10 wrote in his opinion that this -- I'm not deciding anything
11 anywhere about any matter that matters except for the purposes
12 of this case. So, in other words, Rule 408, one ticket, one
13 ride. That case only, can't be used for precedential effect
14 anywhere else, even though that's the only case that that has
15 been cited by the debtors in which anybody made a Rule 408
16 argument that remotely resembled the one that's being made
17 here, and it was rejected.

18 Finally, he -- it's kind of cute the way he does this
19 what we're here about is science not what we're here about is
20 something other than science, a practice that doesn't -- isn't
21 physics. And what is his source for the notion that when we
22 estimate the future liabilities of the debtor pursuant to
23 524(g), that's an exercise in science? Let's see authority for
24 that. Well, Dr. Peterson said that what he did he thought was
25 science, and Ms. Biggs said that she's -- she thought what she

J&J COURT TRANSCRIBERS, INC.

1 did was actuarial science, and, therefore, because they thought
2 what they were doing was science here, that means that it is
3 science. It's pretty interesting that he's willing to take
4 their assertions on that point as gold and treat everything
5 else they have to say as dross.

6 The fact of the matter is Your Honor can figure out
7 perfectly well without the -- without testimony from either Mr.
8 -- Dr. Peterson or Ms. Biggs exactly what it is that's going on
9 here and trying to estimate the inherently unknowable. It's an
10 estimation of something that's unknowable. And with all due
11 respect to Dr. Peterson and Ms. Biggs and whatever bunch of
12 experts they may put up on their side, to say that that's an
13 exercise in science is ridiculous. And, moreover, the -- by
14 that token, they haven't put on any expert of their own who has
15 testified that what they've done to exercise -- estimate their
16 liabilities is, quote, science. What they've done is they put
17 on some people who say that their opinions on medicine and
18 industrial hygiene and risk analysis are some kind of science,
19 but those are only sort of pieces.

20 When it gets to Dr. Florence, I don't hear anything
21 about Dr. Florence talking about science. And, moreover, even
22 if Dr. Florence did talk about science, at the end of the day,
23 as I said earlier in which Mr. Bernick has ignored, when he
24 says his experts aren't lawyers, but they don't have to be,
25 they're being asked collectively through Dr. Florence to tell

J&J COURT TRANSCRIBERS, INC.

1 this Court what kind of a claim has legal validity, and that's
2 not science either. Apart from the fact that it is an invasion
3 of the province of this Court to determine whether claims in a
4 proper setting under proper procedural protections for
5 allowance and disallowance do or do not meet the legal
6 standards for claim validity. That's all I have, Your Honor.
7 Thank you.

8 THE COURT: All right.

9 MR. FINCH: Thank you very much, Your Honor, for
10 indulging us today.

11 THE COURT: Okay. We are -- Mr. Finch?

12 MR. FINCH: No, we're --

13 THE COURT: Okay. We are adjourned until Wednesday
14 morning at 9:00. Thank you. Moana, will you hit that button
15 again, so it turns back on? Okay. Thank you.
